14.5 Reaction Mechanism Lecture Worksheet

What do we know about Kinetics?

- Rate laws tell us how changing the concentrations affect the rate of a reaction
- Certain things generally increase the rate of a reactions
 - o Increasing Temperature
 - Increasing concentration of reactants

So, what are reaction mechanisms?

- Reaction Mechanisms describe the steps involved in a chemical reaction. They tell us how reactants possibly collide to make products
- They relate to the balanced equation since the equation gives us information about the reactions
- They also describe the rate law and we can determine the rate law from looking at the reactions mechanism. Here's how:

1. Determine the Rate Law from the following mechanism

Chemical Equation $2A + B \rightarrow C$

<u>Mechanism 1</u> is a possible mechanism for the above reaction.

 $\begin{array}{ccc} A + B & \overleftarrow{k_1} & AB & (fast to pre-equilibrium) \\ A + AB & \underline{k_2} & C & (slow) \end{array}$ Net equation: 2 A + B \rightarrow C

Determine the Rate Law for this mechanism

	Rate Mechanism	Lecture	Worksheet
Problem #2 Balanced Equation:	$2A + 2B \rightarrow C + D$		
Possible mechanism:	$A + A \longrightarrow X$ (Fast)		
	$X + B \rightarrow C + Y$ (slow)		
	$Y + B \rightarrow D$ (fast)		
Net Equation		-	

Determine the Rate Law for this mechanism

Rate Mechanism Lecture Worksheet

Problem #3

The reaction $2\mathbf{A} + 2\mathbf{B} \rightarrow \mathbf{C} + \mathbf{D}$ proceeds by this mechanism:

$2\mathbf{A} \rightleftharpoons \mathbf{A}_2$	(equilibrium)	
$\mathbf{A}_2 + \mathbf{B} \to \mathbf{X} + \mathbf{C}$	(rate determining)	
$\mathbf{X} + \mathbf{B} \to \mathbf{D}$	(rapid)	

The rate equation for the reaction is

Problem #4 For the reaction

$x_2 + y + z \rightarrow xy + xz$

the mechanism was determined to be

- 1) $X_2 + Y \rightarrow XY + X$ (very slow)
- 2) $X + Z \rightarrow XZ$ (very fast)

What is the rate law for this reaction?
